Internet Access 1. Installing Hardware

1). Open the cover.

Let's go

Getting started with your device.

4). Close the cover

Notes:

Hold the **WPS** and **Power** buttons simultaneously until all LEDs are off to restore your device to the factory default settings.

- 2. Establishing a Connection
- A. Wi-Fi Connection
- 1). Power on your device.

 Use your normal Wi-Fi application on the client to search the available wireless network, when the Wi-Fi LED is blinking.

Notes:

You need to check your Wireless Network Connection. Set the client to obtain an IP address automatically in the Internet protocol (TCP/IP) properties, and the client will get an IP address like "192.168.0.100". 3). Select the SSID of your device, and then click **Connect**.

Notes:

If you modify the security mode, there will be a pop-up window to require the password. Please enter the WPA Key preset by you.

- 4). Wait a moment, the Wi-Fi connection is established.
- **B. USB Connection**
- 1). Connect to the device.

- 2). Power on your device.
- 3). Follow the system prompts to complete the software installation.

4). Wait a moment, the USB connection is established.

3. Accessing the Internet

After successfully establishing the connection, access the Internet in any of the three modes. The default mode is Always On.

Mode	Operations				
Always On	After power on your device, it can automatically				
	connect to the Internet.				
	Login the webGUI configuration page, the				
Manual	default password is admin, and set Connect				
	Internet or Disconnect Internet manually on				
	WAN Connection page.				
	When data transmission is required, your				
On	device can automatically connect to the				
Demand	Internet. If data transmission is not performed				
Demanu	over a period of time, your device will				
	disconnect from Internet automatically.				

Notes:

If you want to modify the detailed parameters of your device, please login the webGUI configuration page by visiting http://192.168.0.1 or http://ufi.home.

Troubleshooting Tips

Problem	Suggested Solution		
can not stablish the	 You need install the software. Run the installation program in path of My Computer > Sun Broadband. 		
etween your evice and PC	 If the driver of your device is abnormal, please install the software again. You need uninstall the software first. 		
	1. Make sure Wi-Fi LED is blue blinking.		
can not stablish	2. Refresh network list and select the correct SSID.		
ne Wi-Fi onnection etween your evice and	 Check the IP address to make sure your client can obtain an IP address automatically in the Internet protocol (TCP/IP) properties.
